

Electrical Safety Recall

AT9300/A LED Dimmer Atom Lighting 200VA Trailing Edge Dimmer

Identification:

This recall covers the trailing edge LED dimmer model AT9300/A with a wattage of 5-200W, length of 56mm and width of 23mm. The affected dimmers can be differentiated from other dimmers with the same model number by the internal metal shaft (dimmers with an internal plastic shaft are not part of this recall).

If homeowners believe they have an Atom brand LED dimmer installed they can check if it is the affected product by the following process:

1. Switch off all light switches connected to the dimmer;
2. Remove the plastic knob (by pulling the knob directly outwards) to identify if there is a metal shaft;
3. Replace the knob; and
4. If the shaft was a metal shaft, follow the directions in the 'Action Required' section below.

These units were sold throughout Australia from 7th July to 30th November 2014.

Safety Issue: Risk of Electric Shock

This product has been manufactured with an internal metal shaft instead of a plastic shaft. The internal clearances from live parts are not as required by the Australian electrical safety standard. Should the external plastic knob be removed, and the switch has been internally damaged or improperly installed, there may be a risk of electric shock.

Action Required: Consumers who believe this product has been installed in their home should contact Atom Lighting on (07) 5537 1022 and ask for Marta who will arrange for an electrician to replace the dimmer. In no circumstance should any consumer attempt to uninstall or disconnect the dimmer switch themselves. Unless the plastic outer knob has been damaged or removed, there is no immediate danger.

Electricians who have installed this product should call (07) 5537 1022 and ask for Marta, who will make arrangements with you to return any remaining stock for a full credit, and for installed dimmers to be replaced. All recalled dimmers must be returned to Atom Lighting's head office, and not to the place of purchase.
